

## Goose Dropping Services

### Do you have goose droppings at your recreational facilities?

Goose droppings are extremely dangerous for youth, and can cause E. Coli and Salmonella infections by children putting goose droppings in their mouth, and putting their hands in their mouth after touching the ground with goose droppings. These effects on a child are severe enough to threaten organ failure and even death – and debilitating such disease at a young age can also have serious developmental consequences. This turns every walk or playtime at your local park and recreation facility into a potential biohazard.

To prevent this, McWeeney Aquatic Consulting is proud to solve this issue by offering:

- Goose dropping pickup
- Removal services
- Haul away services

Contact our firm to learn more about how your goose dropping problem can be addressed.

## Wetlands, Pond & Lake Services

### Do you have any of these issues at your recreational facilities?

- Fallen trees
- Rotting debris
- Pond muck
- Duckweed
- Water meals
- Excessive weeds in the swimming area
- Algae
- Stagnant or smelly water
- Native and non-native aquatic weeds
- Excessive nutrient overload

McWeeney Aquatic Consulting can help without chemicals. In addition to removing fallen trees and rotting debris, our firm offers custom designs, nutrient sinks, bottom diffused aeration systems, and weeding for the above problems. When we take care of the above issues, your recreational facilities will be aesthetically pleasing, cleaner, clearer, and safer for all families that use your facilities for year-round and/or seasonal leisure activities.

Contact our firm to learn more about how your wetlands, ponds, and lakes can be addressed.

## Storm Water Runoff Services

### Do you have issues with your storm water runoff areas?

Storm water runoff areas typically have overgrowth of brush, vegetation, trees, cattails and phragmites. These areas are not maintained properly and should be maintained monthly. These obstructions hinder the flow of water, which causes major problems with respect to your surrounding environment i.e. flash floods, erosion, & clogging. In turn, this is not only hurting public support, safety and leisure turnout for parks and recreation departments – it also compromises storm-water runoff areas.

Some states have stopped mowing completely, which has allowed grass, weeds, and brush to grow out of control. This causes pests i.e. rodents, ticks, rats, and mosquitoes [among other animals and insect populations] to multiply and causes more issues.

Is this what you want to happen at your recreational facilities?

McWeeney Aquatic Consulting knows that parks and recreation facilities and its related environments should be: green, clean, and pristine. That is why we are the only firm in the state offering specialty wetland/slope mowing and trimming to maintain the storm water runoff areas. Our firm offers monthly services to address this problem. In addition, wherever there are:

- |                |                    |                |
|----------------|--------------------|----------------|
| • Watercourses | • Retention basins | • Outlets      |
| • Slooshways   | • Detention basins | • Spillways    |
| • Brooks       | • Berms            | • Access roads |
| • Streams      | • Inlets           |                |

It is important to maintain these areas so the water flows quickly and smoothly to and through these areas, which will eliminate flooding and damage leading up to erosion and destruction.
